Operating System: Windows 11 Enterprise
Processor: 12th Gen Intel Core i9-12950HX 2.30 GHz
RAM: 32 Gb
Stata Version: Stata 18.5 (64 bit) for Windows

Data and Code for:

“Do Capital Grants Improve Microenterprise Productivity?”
(Laurin Janes, Michael Koelle and Simon Quinn)

This document lists the Stata code used to create the tables and figures printed in the paper and the appendix, and the steps required to download the data from the original publications.

User should change the path at the beginning of the master do-file for replication ('_Master_MicroenterpriseCapitalProductivity.do').

Authors of the manuscript have legitimate access to and permission to use the data used in this manuscript (with access described shortly).

Separate files have been provided for all tables and figures in the main paper and the Online Appendix. The replicator should expect the Stata code to run for about 100 minutes.

Details on each Data Source

The paper analyzes secondary data from two published papers:

De Mel, McKenzie and Woodruff, "Returns to Capital in Microenterprises: Evidence from a Field Experiment", Quarterly Journal of Economics, 123(4), 1329-1372.

This data is available at <https://microdata.worldbank.org/index.php/catalog/1243/>. The data files required are:

- SLMSround1.dta
- SLMSround2.dta
- SLMSround3_labeled.dta
- SLMSround4.dta
- SLMSround5_labeled.dta
- SLMSround6.dta
- SLMSround7.dta
- SLMSround8.dta
- SLMSround9.dta
- SLMSround10.dta

- SLMSround11.dta
- SLMSround12.dta
- SLMSround13.dta
- SLMSMaster_web.dta

The notes for each of these files are provided in the 'Data Description' tab of the download page.

Fafchamps, McKenzie, Quinn and Woodruff, "Microenterprise Growth and the Flypaper Effect: Evidence from a Randomized Experiment in Ghana", Journal of Development Economics, 106, 211-216.

This data is available at <https://microdata.worldbank.org/index.php/catalog/2249/study-description>. The data files required are:

- GhanaBaselineSingle_la.dta
- GhanaRound2Single_la.dta
- GhanaRound3Single_la.dta
- GhanaRound4Single_la.dta
- GhanaRound5Single_la.dta
- GhanaRound6Single_la.dta
- ReplicationDataGhanaJDE.dta

The notes for each of these files are provided in the 'Data Description' tab of the download page.

Software Requirements

Stata code was last run with version 18.5 and requires the following packages for estimation and saving output:

- qreg2
- xtpattern
- reghdfe
- estout
- winsor
- sg71
- xtabond2
- ivreg2
- leebounds
- sg71

The master do-file includes code for installing all of these packages; currently, this code is commented out; uncommenting will allow for automated installation. (Note, in any event, that package sg71 may need to be installed directly from the Stata command line.)

Setting file paths

Place all do-files in folder “maindir”, where “maindir” is a custom file path on your machine. Generate a subfolder to “maindir” called “Data”; place all of the downloaded data in this folder.

Description of replication code

Do-files in director “maindir” will combine the downloaded datasets, then generate all tables and figures in the paper and the appendix. Tables will be saved in “maindir/Results/Tables”; graphs will be saved in “main/Results/Graphs”; Stata log-files will be generated in “maindir/Results/Logs”. (The folder “main/Results/IntData” will store some intermediate datasets. Each of these subfolders will be generated by the do-files.)

The structure of files to generate tables and figures is self-explanatory from the list of do-files called in the master do-file.

Additional notes

The do-files generate output as Stata log files (in text format), and as tex files. (For Table 1 and Appendix Table A.22, the tex file was constructed manually, using results shown in the log file. Note that Appendix Table A.25 does not involve empirical analysis – it summarises the categorization of individual asset items – and therefore does not have a corresponding replication file.)
